No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour ceils, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon.
                                                                                                                                                                                                                                                                                       25-FEB-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1;
                                    The present sequence represents an indolicidin analogue. The present invention describes compositions and methods for treating infection, especially bacterial infections. The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                               New indolicidin peptide analogues - useful for, e.g. enhancing activity of antibiotic or overcoming tolerance, acquired resistance or inherent resistance of microorganisms
                                                                                                                                                                                                                                                                                                                                                                                     17-SEP-1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (X'indolicidin) analogs are stable and have antimicrobial activity against gram positive and negative bacteria (e.g. Staphylococcus aureu Escherichia coli and Salmonella typhimurium), yeasts and fungi (e.g. Candida albicans, Cryptcocccus neoformans), protozoa (e.g. Giardia species and Acanthamoeba species), and viruses (e.g. HIV-1). They can be used for reducing or inhibiting the growth or survival of microorganisms in an environment e.g. a food or food product, a solution, an inanimate object comprising a surface, or a mammal. The present sequence is a protein comprising three copies of Indol 1-13 each separated by a hexapeptide spacer sequence. A recombinant construct encoding this sequence was used for the expression of Indol-homoserine (Hse) analog. The ability of Indol-Hse analog to maintain antimicrobial activity provides a means tenderical activity provides a means tenderical activity provides and the construction antimicrobial activity provides and the sequence was used for the supersection of Indol-homoserine (Hse) analog. The ability of Indol-Hse analog to maintain antimicrobial activity provides a means the provides and the sequence was used for the sequence was used for the sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Xaa9 = at least one amino acid;
provided that if Xaa1 is present, Xaa8 = Hse, Met or Met-Xaa9-Met;
and further provided that: if Xaa2 is absent, Xaa1 is absent; if Xaa3 is
absent, Xaa1 and Xaa2 are absent; if Xaa4 is absent, Xaa1, Xaa2 and Xaa3
are absent; and if Xaa5 is absent, Xaa1, Xaa2, Xaa3 and Xaa4 are absent.
The indolicidin analogues can be used to create a fusion polypeptide
consisting of the analogue linked to a peptide. The indolicidin
analogues have antimicrobial activity against gram positive bacteria,
gram negative bacteria, yeast, fungus, protozoa and viruses (e.g. HIV-1).
They are also active against helminths. The analogues can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reducing or inhibiting growth or survival of a microorganism. They can be used for treating infections. They can also be included in a liquid such as water or an aqueous solution, e.g. contact lens solution. The analogues have potential uses in food products, and in objects such as the surface of an instrument used to prepare food or to perform surgery. Transgenic plants or animals useful in the food industry can be produced by introducing a nucleic acid molecule encoding an indolicidin analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Xaa4 = Xaa5 = Xaa6 = Xaa7 = Xaa8 = Xaa9 = Xa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Xaa2 =

Peptides AAY57109-Y57138 and AAY57143-Y57144 are new indolicidin analogues, which have a homoserine residue and/or a truncated amino terminal region. The analogues have the following amino acid sequence:
                       Falla TJ,
                                                                         (UYBR-) UNIV BRITISH COLUMBIA
                                                                                                                                                                                         23-AUG-1996;
                                                                                                                                                                                                                                                 06-MAR-1997.
                                                                                                                                                                                                                                                                                                      W09708199-A2
                                                                                                                                                                                                                                                                                                                                                              Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a specifically claimed novel isolated CC cationic peptide which has antimicrobial activity. The amino acid CC sequence of antimicrobial cationic peptides (including the present CC sequence) is selected from: XIXIPTOXXXXXPTO(XXXPTO)XXX3(X5)o; CC XIXIPTOXXXXX4(X5)PTOXXXXXX; XIXIPTOXXXXXPTO(XXXPTO)XXX3(X5)o; CC XIXIXXXXXXPTO(XXXPTO)XX2(X5)m; where m = 1-5; n = 1-2; o = 2-5; r CC = 0-8; u = 0-1; X1 = Ile, Leu, Val, phe, Tyr, Trp or Met; X2 = Trp or CC Pro. The peptides are preferably amidated or carboxymethylated. The CC peptides may be used in methods for inhibiting the growth of a bacterium CC or yeast, or for inhibiting an endotoxaemia or sepsis associated CC disorder in a subject. The peptides have a broad activity against the CC antibiotic resistant bacteria, combined with activity against the CC medically important fungus Candida albicans. In addition, the peptides CC may be used as sterilants or preservatives of materials susceptible to CC microbial or viral contamination, e.g. in processed foods to inhibit CC salmonella, Yersina and Shigella. The peptides are compact and tend to CC have a unique polyproline type II extended helix structure that permits consistent than permits the membrane with relatively few amino acids. The peptides consoled the ability to work synergistically with antibictics, and in

The analogues are used to treat infections caused by bacteria (Gram positive or negative, or anaerobic); fungi (yeast or moulds); parasites (protozoa, nematodes, cestodes or trematodes) or viruses. Typical of very many pathogens that can be controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola becontrolled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola becontrolled are Leishmania, Engletchella pertussis. Stabbulococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 materials. The analogues are administered by injection, lavage, orally or topically, generally at 0.1-50 mg/kg. These analogues have a broader spectrum of activity than indolicidin and modification as compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hepatica, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus aureus, Listeria, Clostridium, rotavirus and papilloma virus. Compounds derived from the analogues may be used similarly; the compounds may also be prepared from antibiotics or antiarrythmic agents. The analogues may be used therapeutically or to coat medical devices; also they are useful as surface disinfectants, as additives to shampoo or soaps, as insecticides or herbicides, or as preservatives for foods and technical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 13; Page 89; 129pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid - vectors, transformed cells and antibodies, conjugates with polyoxyalkylene glycol and fatty acid to rtoxicity, useful therapeutically, as disinfectants etc.

fungi (yeast or moulds); parasites (protozoa, nematodes, cestodes or trematodes) or viruses. Typical of very many pathogens that can be controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola hepatica, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus aureus, Listeria, Clostridium, rotavirus and papilloma virus. Compounds derived from the analogues may be used similarly; the compounds may also be prepared from antibiotics or antiarrythmic agents. The analogues may be used therapeutically or to coat medical devices; also they are useful as surface disinfectants, as additives to shampoo or soaps, as insecticides or herbicides, or as preservatives for foods and technical materials. The analogues are administered by injection, lavage, orally or topically, generally at 0.1-50 mg/kg. These analogues have a broader spectrum of activity than indolicidin and modification as compounds

polyoxyalkylene-modified Novel pharmaceutical composition cationic containing optionally c peptides, useful for treating tumours activated

Disclosure; Page 15; 94pp; English.

This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, approximate the composition of the composit uterus, colon

                                                                                                                                                                  This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)—modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrig resistant phenotype. The

                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a specifically claimed cationic peptide from the present invention. The present invention describes compositions and methods for treating infection, especially bacterial infections. The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance; (b) activity of the antibiotic agent, to overcome: (b) tolerance; (c) inherent resistance. The combinations of antibiotics and cationic peptides can provide synergistic activity against a microorganism that is tolerant, inherently resistant, or has acquired resistance to an antibiotic agent. They can be used for killing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-SEP-1998

                                                                                                                                     MBIII is a small (mol.wt. 1879) cationic peptide. DNA encoding MBIII has been incorporated into vector pp21-BI, in which the replication leader (R21) sequence of RepA (see also AAW71686) is joined to 2 Hpro peptides (see also AAW71692), to provide a vector for expression of MBIII in host cells. The invention provides controlled replication plasmid vectors (RAMP vectors) comprising a replication origin of a small cryptic plasmid and a gene encoding RepA. The vectors can reach very high levels of plasmid replication, but are not lethal to the host cell, and can be used to direct the high level expression of e.g. cytokines, antigens and therapeutic proteins.
                                                                                                                                                                                                                                                                                                                                           Increasing plasmid copy number in a cell with the repA gene product - and an small cryptic plasmid ori sequence, useful for high level expression of e.g. cytokines, antigens or therapeutic proteins
                                                                                                                                                                                                                                                                                                                                                                                                                               Burian J, Kay WW;
